

Abundance and Run Timing of Adult Pacific Salmon in the Tuluksak River, Yukon Delta National Wildlife Refuge, Alaska, 2004

A resistance board weir was used to collect abundance, run timing, and biological data from salmon returning to the Tuluksak River, a tributary to the lower Kuskokwim River, between June 22 and September 10, 2004. Data collected were used in-season to manage the commercial and subsistence fisheries in the Kuskokwim area. A total of 11,796 chum *Oncorhynchus keta*, 1,475 Chinook *O. tshawytscha*, 136 sockeye *O. nerka*, 496 pink *O. gorbuscha* and 20,336 coho salmon *O. kisutch* were counted through the weir during 2004. Peak weekly passage occurred July 4 to 10 for Chinook and sockeye salmon, July 18 to 24 for chum and pink salmon, and August 15 to 21 for coho salmon.
